What the company does

Larkspur is an early entrant in continuous soil-carbon measurement for row-crop farms. It sells in-field probes plus a subscription dashboard reporting soil organic carbon, moisture and nitrate levels every ten minutes.

Twelve farms in Iowa and Nebraska run the probes across 48,000 acres. The company has not signed any commercial supply agreements; all twelve farm deployments are unpaid pilots that convert to paid subscriptions in the 2027 season.

People

Maren Halvorson (CEO) ran field trials for a regional agronomy cooperative. Tobias Okafor (CTO) wrote embedded firmware for irrigation controllers. Headcount is 14, of whom 9 are engineers.

Money

Seed raise: $6M
Prior funding to date: $3.2M
Pricing: $34M pre-money, implying $40M post-money on the $6M seed.
Funding so far totals $3.2M of venture capital plus $900K of non-dilutive state grants for agricultural technology.
Quillback Ventures led the pre-seed round in 2023.

Cash

Management expects roughly 20 months of operating runway after the seed closes.
Net cash burn averaged $210K per month in the third quarter of 2026.

Size of the prize

If verification bodies adopt probe data, management sees the business reaching $40M to $60M in yearly revenue at maturity.
No verification body has yet accepted continuous probe data for credit issuance.

What could go wrong

Probe calibration drifts in high-clay soils and requires a manual recalibration visit.
The European expansion plan is unfunded under the current round.
Two growers account for 41% of deployed acres.
Hardware gross margin is negative at current volumes.
